ASSUMPTION:

Months up to the cut-off use actuals. Months after it are held at budget.

NovaPay Financial Performance Report

Built with SQL Server (staging and reporting views) and Power BI | All data is simulated for a fictional company for portfolio purposes. No real company or figures are used.

Definitions

- **Net Operating Income (NOI):** Revenue minus cost of revenue minus operating expenses. No tax or interest is shown below it.
- **Operating Variance:** Actual restated at budget FX rates, minus budget. It shows real performance with currency held constant.
- **FX Impact:** Reported actual minus the restated actual.
- **Take rate:** Payment fee revenue divided by total payment volume (TPV).
- **Net Interest Margin (annualised):** (Interest income minus cost of funds) x 12, divided by the loan book.
- **Cost of Risk (annualised):** Credit loss provision x 12, divided by the loan book.
- **NPL ratio:** Non-performing loan balance divided by the loan book (month-end balances).
- **CAC:** Marketing and acquisition spend divided by new customers.
- **Revenue per FTE (annualised):** Revenue x 12, divided by headcount.

Method and Conventions

- Reporting currency is USD. Actuals are translated at each month's rate, and the budget at a fixed rate (the January rate of each year).
- Costs are shown as negative amounts, so a positive variance is favourable. Operating Expenses is described as "over" or "under" budget.
- Latest estimate = actuals up to the chosen cut-off month, plus budget for the remaining months.
- Ratios are calculated as sum divided by sum, never as averages of ratios.

Data Quality Log

- **Duplicates (found via row count: actuals 2,604 vs budget 2,592):** 12 exact duplicate rows in actuals. Removed in the reporting view, staging left unchanged. Counts then match at 2,592.
- **Orphan keys:** 5 rows with cost center 99, which is not in the cost-center list.
  Kept under "Unmapped - Needs Review".
